SUMMARY

Full-Stack Software Engineer with experience building scalable cloud applications and artificial intelligence (AI) workflow automation with JavaScript, TypeScript, React, Next.js, Object-Oriented Programming (OOP) languages, and Amazon Web Services (AWS). Bilingual (English/Spanish) with strengths in system design, collaboration, and mentoring.

EDUCATION

- **Bunker Hill Community College A.S. in Computer Science | A.A. in Mathematics Concentration | PHI THETA KAPPA** | Expected Graduation: June 2027
- **Coursera** | [Meta Front-End Developer](#) | Completed: January 2025
- **CISCO Network Academy** | [C++ Essential 1](#) and [C++ Essential 2](#) | Completed: July 2025

PROFESSIONAL AND TECHNICAL SKILLS

- **AI & Automation:** Claude Code, prompt engineering, context engineering, AI agents, evaluations (evals), MCP, RAG, OpenAI API, Ollama, LangChain, GPT-4, Whisper
- **Languages:** TypeScript, JavaScript, Python, Java, C++, SQL
- **Web & Cloud:** React, Next.js, Node.js, FastAPI, AWS, Docker, Vercel, CI/CD.
- **Testing & Data:** Playwright, Pytest, Unit Testing, PostgreSQL, MongoDB

RELATED EXPERIENCE

Software Engineer Intern | Inrupt | Boston, MA (Hybrid) | April 2026 - Present

- Build with Claude Code daily on a TypeScript and Python codebase, automating Jira ticket creation, pull requests, and debugging through an AI-assisted workflow
- Apply context engineering to design the environment Claude runs in a CLAUDE.md entry point that routes context, reusable skills, and scoped subagents (AI agents) instead of one monolithic prompt, while enforcing CLI scripts over MCP calls to keep agent behavior deterministic and reduce token cost
- Built evaluation harnesses and self-evaluation gates that re-run when output misses criteria, plus reviewer subagents, hooks, and slash commands that make LLM output repeatable, applying Anthropic best practices
- Collaborated with the engineering team to ship React and CSS frontend features through code review and version control

Full-Stack Developer & Mentor | ULEM | Boston, MA | May 2021 - Feb 2025

- Partnered with program coordinators, curriculum designers, and volunteer instructors to plan and run the bootcamp series, adjusting pacing and content based on group feedback each week
- Rebuilt the organization's web UI with React and Tailwind, cutting page load times by 40% after coordinating with staff to map out their actual navigation pain points first
- Mentored 50+ early-career technologists through mock interviews and workshops, many of whom landed their first tech roles within six months
- Led weekly frontend bootcamp sessions, reviewing participants' work in real time and adjusting explanations based on where people got stuck

AI Engineer Intern | North Light AI | Remote | September 2024 - Jan 2025

- Designed and deployed AI tools using GPT-4 and Whisper to automate audio transcription and document summarization, reducing workflow bottlenecks by 32%
- Built and deployed containerized machine learning pipelines from data ingestion through model evaluation in a local development environment, improving model accuracy and reliability through validation, logging, and retry controls
- Worked across a remote Agile team of 5 to ship sprint deliverables on time, handling task tracking, async communication, and handoffs between engineers in different time zones
- Brought teammates up to speed on the GPT-4 and Whisper tooling by documenting the integration patterns and walking through them in two team syncs, which cut onboarding time for new contributors

Software Engineer Intern | Wayfair | Boston, MA | May 2023 - August 2023

- Refactored legacy services into Python microservices alongside senior engineers, working through their existing architecture before touching anything and raising blockers early in daily standups
- Built real-time Kafka data pipelines that brought event ingestion latency down significantly, collaborating with the data team to define schema contracts before any code was written
- Containerized internal tools with Docker and integrated CI/CD workflows, shortening deployment cycles by 30% across multiple environments
- Participated in code reviews on both sides, submitting PRs for feedback and reviewing teammates' work, which helped me ramp up on the codebase faster than going it alone would have

PROJECTS

Book Recommendation System | Python, OpenAI API, LangChain, Chroma

- Built a semantic recommender using OpenAI embeddings and LangChain with a Chroma vector database, ranking titles by topic and emotional tone. [GitHub Repo](#)

Developer Portfolio | Next.js, TypeScript, Vercel AI SDK, Groq, MongoDB

- Built a grounded, streaming AI chat assistant with the Vercel AI SDK and Groq that answers questions about my work, with tool-calling lead capture and prompt-injection defenses. [GitHub Repo](#)

Personal Knowledge Base "Second Brain" | Obsidian, Graphify, Qdrant, LangGraph, Ollama

- Built a local, multi-vault GraphRAG system: a Graphify knowledge graph plus Qdrant vector search, queried by a self-grading LangGraph agent on local Ollama models that retrieves, retries, and synthesizes across vaults. Built with **Claude Code**
